

IT Disaster Recovery Management

Transform Your Program and Be Ready for Whatever

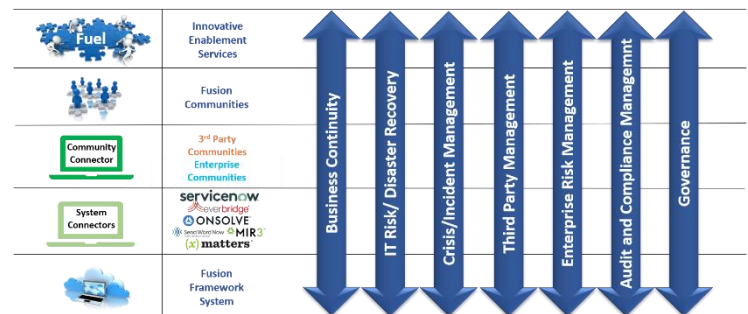

Digital Transformation is an important goal that can lead an organization to make many important changes, but at its core, it means leveraging new technologies so you will be ready to change and evolve faster than you can now.

If you are working with a basic planning system or still making due with Excel spreadsheets, you are unnecessarily putting your organization at risk. By transforming to a system that flexes to new challenges as they arise and helps you adapt to situations that are impossible to predict, you will be positioned for the digital future. As competition and technology drive the speed of change to new levels, how do you choose the right IT Disaster Recovery Planning solution that can keep up with your transforming organization?

Build an IT Disaster Recovery Program on a System that Adapts to Any Situation

Without the right management system, plans become outdated and runbooks sit on personal drives only known to the person who created them. When a real incident occurs, planning efforts are often not effective because they can't be adapted to what is really happening in the moment.

With the Fusion Framework System, you will capture an information foundation that empowers you to assess the impact of a situation on IT and on the business. You will build a tailored runbook in minutes by picking just the right parts of your plans that apply to the current situation. You will have a finely tuned action plan containing exactly what to do in correct sequence with dependencies mapped so nothing starts before it should. You can give anyone access to tasks on their mobile device. Manage each situation from a command and control center that gives you visibility across plans during both exercises and recoveries.

Grow Without Limits

Build an Information Foundation

Track your servers, infrastructure, endpoints, cloud services and vendors, integrating your planning with your CMDB for accuracy and efficiency.

Business and Technical Impact Analysis

Assess the most important risks and impacts and gather a foundation of company data to build strategies and plans. Be prepared to move beyond analysis to impact management.

Exercise and Incident Management

Create and run exercises in far less time. Keep skills fresh and identify gaps. Leverage a complete command and control solution that provides visibility thru a single pane of glass.

IT Disaster Recovery Planning

Maintain runbooks, procedures and plans of any type across your entire organization in a single data-centric system that focuses on being prepared to execute with facts that lead to great decisions rather than static plan documents.

Cross-Plan Dependencies

Coordinate plans across functions so your activated plan will enforce the correct sequence of operations for efficiency.

Advanced Plan Activation

Build a targeted response for any situation.

Integration with Your CMDB/ITSM System

Synchronize data with your CMDB. Drive tasks into your IT Service Management system and enable IT staff to remain in their system.

IT Vendor Risk Management

Grow into new risk agendas such as managing vendor risk assessments with a straightforward & practical system to manage a broad array of risks.

Program Management

Manage the policies, plan maintenance processes and standards across all program components

The Fusion Difference for IT Disaster Recovery

The Fusion Framework System will support your digital transformation now and, in the future, because it is built to be flexible and support your changing organization with ease. With Fusion Framework, you will be building on the following keys to success:

No Constraints – by choosing the most comprehensive and configurable IT DR planning system available, you will never hit a wall based on limited functionality. Build on a system that has the core areas covered including user hierarchy and roles, security, extensibility of the data, workflows, APIs, and reports and dashboards.

An Information Foundation at Its Core – share important information between business continuity, IT disaster recovery, and other risk management programs all on one integrated system when you are ready to expand for better insight and outcomes with less effort.

Plan Procedure Library – Manage your plans and procedures from a central library based on an information foundation where you catalog best practices, enforce standards, push out updates with a click, and enable areas that can be tailored by each department.

Command and Control Across Systems – Manage exercises and incidents effectively through a single pane of glass command and control system that you can access anywhere on any device. The system orchestrates activities and tasks (not just data) across business and IT systems for effective and quick recoveries, maximizing productivity and minimizing idle time.

Tools to Engage Your Entire Community – Extend access to occasional users such as your IT staff that participate in exercises with simple mobile tools to engage the entire enterprise. Provide targeted task assignments, share important documents, and send two-way alerts and situational awareness updates.

Quality of Integration – Flexible and complete integration to the systems related to your mission such as your ENS, your ITSM and CMDB, and your HR database. Bi-directional data synchronization and support for task orchestration during incidents are vital, while making sure you can change direction on which products you use without a major impact at any time.

About Fusion Risk Management

Founded with a vision to transform how risk and business continuity programs are managed, Fusion Risk Management is dedicated to helping organizations improve integrated risk, business continuity, IT disaster recovery and crisis management programs. Based on the premise that an integrated information foundation and flexible tools can meet any program's needs, the Fusion Framework System designed to adapt and evolve to drive customer success.
